How to configure Doom for easy image pasting into org-mode files?

I want to be able to copy an image onto the system clipboard and then paste it into emacs. The image would land in `./images` (or similar, but configurable), with the file link inserted at point and the image shown inline.

Is there a package that does this or similar?

Have a look at org-download.

On windows I'm pasting from the clipboard using convert from ImageMagick. Below is the config I hacked together from other people's config I found on the github page.

```
(setenv "PATH" (concat "c:/Path/to/dir/containing/convert/binary" (getenv "PATH")))

(use-package org-download

:after org

:bind

(:map org-mode-map

(("s-Y" . org-download-screenshot)

("s-y" . org-download-yank))))

(setq org-download-screenshot-method "convert clipboard: %s")

(setq org-download-method '+org/org-download-method)
```
